Business Challenges

Most organizations do not have a unified view of the customer. They are plagued by disparate applications and copious amounts of un-integrated data. This forces the analysts in these organizations to jump through multiple hoops each and every time a question needs to be answered for senior management. Eliminating these inefficiencies and streamlining these processes reduces costs and administrative activities. The ability to do so gives organizations a serious competitive advantage, which when leveraged properly, leads to a significant increase in market share.

Solutions Overview

SAIGE assists clients in designing and implementing technical architectures that integrate and streamline business processes, operational applications, and data. These architectures are tailored to meet specific customer needs and enable organizations to make more informed business decisions.

Technical integration is essential for enterprises that want to successfully target, acquire, develop, and retain customers. SAIGE's technical integration services help to create a unified and comprehensive view of the customer that drives meaningful business actions across the enterprise.

SAIGE delivers successful implementations whether they are new CRM (Customer Relationship Management) software tool installations or existing application upgrades. SAIGE utilizes its extensive business, technical, and industry knowledge and leverages leading practices gathered by experienced consultants. Therefore, each stage of the integration process – from requirements gathering and process design through user acceptance and production support – will be executed to meet enterprise's goals and expectations.
